Unclog a Toilet

Maintenance Troubleshooting · https://smarteggmgmt.com/faq/unclog-a-toilet/

If your toilet is clogged, here are some troubleshooting steps to help you clear the blockage:

1. Stop Flushing:

- Avoid flushing again, as this can cause overflow. If the bowl is full, wait for the water level to lower before proceeding.

2. Use a Plunger:

- **Select the Right Plunger**: Use a flange plunger, which is more effective for toilets.
- **Position the Plunger**: Place it over the drain hole, ensuring a good seal.
- **Pump Up and Down**: Push down and pull up rapidly to create suction. Repeat this several times before checking if the clog clears.

3. Add Hot Water:

- If plunging doesn’t work, try pouring hot (not boiling) water into the bowl from waist height. This can help dissolve or loosen the clog.
